

## Brow Well Trout Hatchery – Reduction in Mortalities

The graph shows the significant reduction in mortalities at the Brow Well Hatchery following the full implementation of emitters (four installed) on 25/09/2003.

The mortalities were due to a number of disease vectors. The peak on 15/9/2003 was due to a flash flood affecting the farm, bringing in dirty water. The average mortalities reduced from an average of approx 120 down to under 20 a day.
